## **DETAILED ACTION**

### ***Allowable Subject Matter***

Claims 1-7 are allowed.

Regarding independent claim 1, the closest prior art to the instant invention is Mihara et al. (JP 406047603A). MIHARA ET AL. teaches a method of machining a work in a numerically controlled lathe having a rotatable spindle, a first tool rest (22) and a second tool rest (23), the method being characterized by comprising the steps of: judging which of the first tool rest and the second tool rest tools used in current machining are installed on; judging whether tools used in next machining are the tools installed on the first tool rest or the tools installed on the second tool rest ('603, abstract and figure 3). MIHARA ET AL. also teaches positioning the appointed tool selecting an appointed tool out of a plurality of tools by moving a tool slide in X and Y axes directions and positioning the appointed tool in an appointed tool insertion start point determined for every tool or tool set, a process for cutting a work by moving the tool under an appointed cutting condition, and a tool interchange process for moving the tool to its appointed retreat position determined for every tool or tool set after the cutting process is finished and moving the tool directly so that it may reach the tool insertion start point for a subsequently selected tool from the retreat position in the shortest time (i.e. obtaining the interference boundary positions for both the first tool rest and the second tool rest) ('603, abstract).

Art Unit: 3724

However, MIHARA ET AL. fails to anticipate or make obvious obtaining a feed speed for the other tool rest so that the other tool rest on which the tools used in the next machining are installed reaches the interference boundary position within a same time as a time in which the one tool rest reaches the interference boundary position, and moving the other tool rest toward the interference boundary position at an obtained feed speed; and increasing a speed of the other tool rest to a fast feed speed when the other tool rest passes the interference boundary position so as to move the tools used in the next machining to a machining start position in case where a feed speed obtained for the other tool rest is less than the fast feed speed.
